

### **flame test atomic emission pdf**

The phenomenon just described is an "atomic emission" phenomenon. This statement may seem inappropriate, since it is a solution of metal ions (and not atoms) that is tested. The reason for calling it atomic emission lies in the process occurring in the flame. One of the steps of the process is an atomization step. That is, the flame converts the metal ions into atoms.

### **Principle of Atomic Absorption /Emission Spectroscopy**

Students will record the dominant flame color observed. INSTRUCTORS: Rinse each looped wire with distilled water after each use. Place the rinsed looped wire into the empty test tube provided. Analysis: For each metal cation flame test performed, determine the wavelength corresponding to the observed flame color from the table below.

### **Basic Principles of Atomic Absorption and Atomic Emission**

Light emission by atoms is a foundational principle of quantum chemistry. Atoms contain electrons that occupy discrete energy levels. The actual energy of each state (level) depends upon several factors: the nuclear charge, the distance of the electron from the nucleus, and the number of other electrons between the nucleus and the electron of interest.

emits a characteristic emission spectrum, often called an "atomic fingerprint". When an element is heated, it may emit a characteristic color, usually corresponding to one of the colors in its emission spectrum.
